# Change your advertising banner in no time

Left: In this case your advertising banner is suspended from the roof.

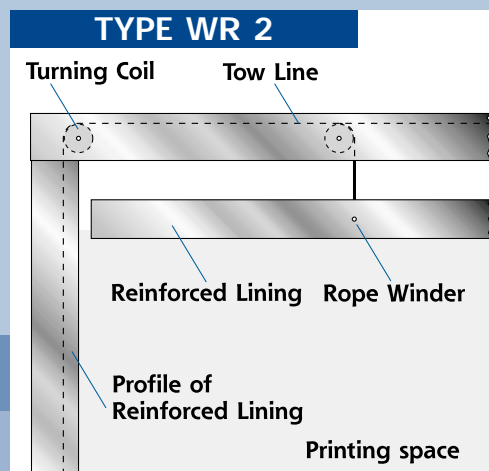

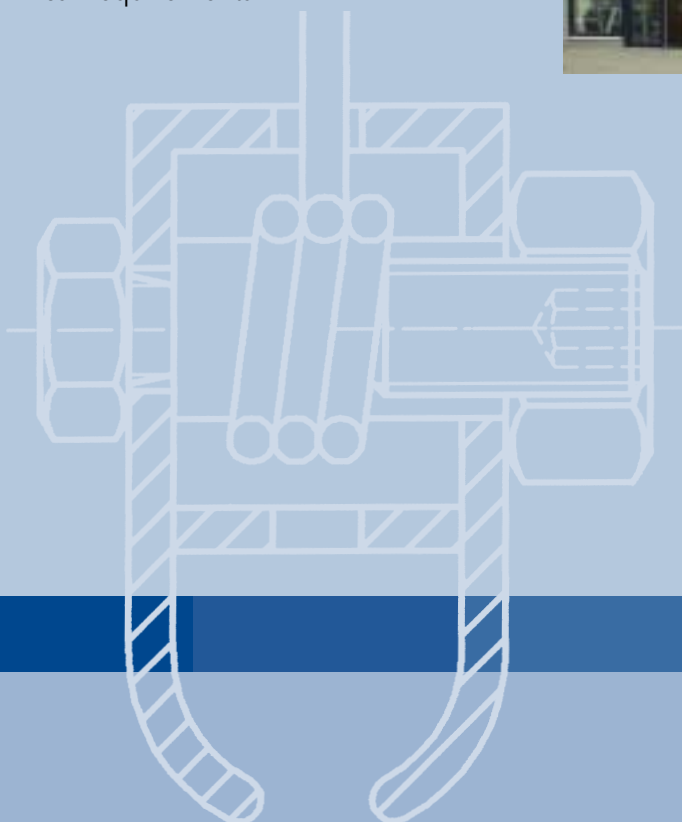

This frame system allows a suspension of your advertising banner in front of windows.

The development of our suspension system results from our wish to satisfy the demands of our clients.

The advertising banner is placed into focus – the frame, because of its size and design remains in the background and still meets highest technical requirements.

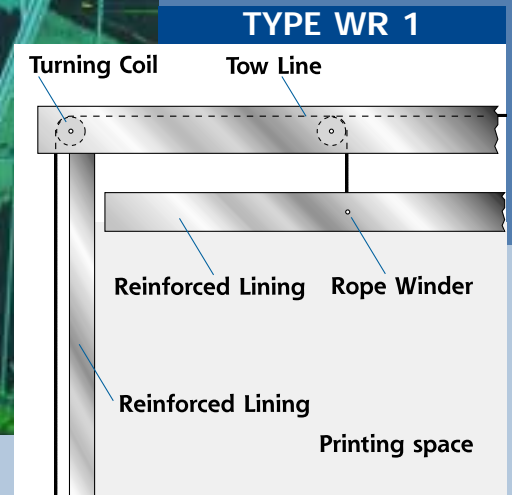

This is also presented and certified by the protection of our suspension system as patented design.  
Official Registration No. : 201 179 28.8

With type WR 2, the rope is laterally guided by an internal method.

Below: With the type WR 1, the rope is laterally guided by an external method.

The suspension systems consist of Aluminium profiles and by using a tow line device an advertising print is inserted. Tow line, turning facilities as well as tow winder devices are made of high-grade steel guaranteeing utmost life.

There are two types available:

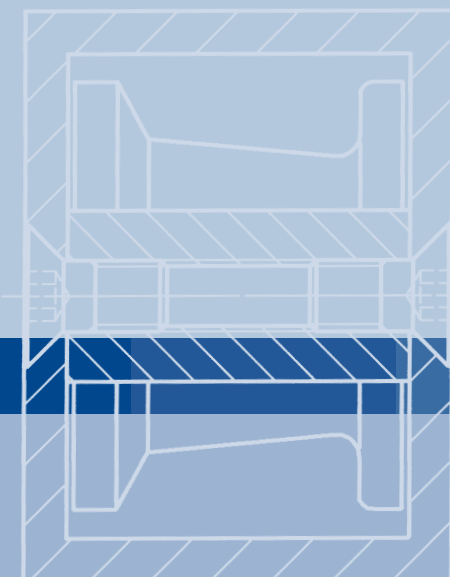

**Type WR 1**

**Type WR 2**

- **WR 1** the rope is guided laterally by an external method.
- **WR 2** the rope is guided laterally by an internal method. All ropes are guided inside the frame.

Meriting the technical devices, our suspension systems can be adjusted individually to your printing size and façade.
